

Project Proposal: BookIT

After refining the idea, I think we should make BookIT, a venue discovery and reservation website.

Objective

BookIT will help users find and reserve venues for different types of events such as weddings, birthday parties, business meetings, conferences, workshops, gaming tournaments, and community events.

Instead of booking event tickets, the website focuses only on venue reservation, which keeps the project more realistic and easier to develop within our assignment requirements.

How It Works

The website will have two main functions:

For Customers

Browse available venues.

Search and filter venues by location, event type, capacity, and price.

View venue details (photos, description, facilities, pricing, and availability).

Submit a reservation request through a booking form.

For Venue Owners

Submit their venue through a "List Your Venue" form.

Provide venue details, photos, capacity, pricing, and contact information.

The website will simulate a submission process (e.g., "Your venue has been submitted for review") instead of actually publishing listings, since we won't have a backend database.

Key Features

Modern multi-page website

Venue search and filtering

Venue detail pages

Reservation form with validation

"List Your Venue" submission form

Price calculator (optional, based on hours or guests)

Responsive design using Flexbox/Grid

Animations and jQuery interactions

localStorage to remember user preferences or recently viewed venues
